Abstract

A data-driven, hierarchical information navigation system and method enable
search of sets of documents or other materials by certain common attributes that
characterize the materials. The invention includes several aspects of a data-driven,
hierarchical navigation system that employs this navigation mode. The navigation
system of the present invention includes features of an interface, a knowledge base and a
taxonomy definition process and a classification process for generating the knowledge
base, a graph-based navigable data structure and method for generating the data structure,
World Wide Web-based applications of the system, and methods of implementing the
system. Users are able to search or browse a particular collection of documents by
selecting desired values for the attributes. A data-driven, hierarchical information
navigation system and method enable this navigation mode by associating terms with the
materials, defining a set of hierarchical relationships among the terms, and providing a
guided search mechanism based on the relationship between the terms. In another aspect
of the invention, implementations of the invention may be scalable through parallel or
distributed computation. Implementations of the invention may employ master and slave
servers in a hierarchical configuration.
